

Acrocephalus agricola

Annex I	No
International action plan	No

Paddyfield Warbler, *Acrocephalus agricola*, is a species of passerine bird in the warbler family found in wetland ecosystems. It is a summer visitor to the eastern European countries adjoining the Black Sea (Bird in Europe 2004). This species breeds in reeds (*Phragmites*), chiefly low-growing and open, as well as reedmace (*Typha*) and neighbouring bushes or tamarisks (*Tamarix*), often on the landward edges of lakes and in river valleys (European Red List 2015).

Acrocephalus agricola has a breeding population size of 3000-20200 pairs and a breeding range size of 7700 square kilometres in the EU27. The breeding population trend in the EU27 is Unknown in the short term and Unknown in the long term.

The EU population status for *Acrocephalus agricola* is Unknown, as the data reported were not sufficient to assess the population status of the species.

Assessment of status at the European level

Breeding population size	Breeding population trend		Range area	Breeding range trend		Winter population size	Winter population trend		Population status
	Short term	Long term		Short term	Long term		Short term	Long term	
3000 - 20200 p	x	x	7700						Unknown

See the endnotes for more informationⁱ

Acrocephalus agricola
Report under the Article 12 of the Birds Directive

Short-term winter population trend was not reported for this species.

This information is derived from the Member State national reports submitted to the European Commission under Article 12 of the Birds Directive in 2013 and covering the period 2008-2012. More detailed information, including the MS reports, is available at:
<http://bd.eionet.europa.eu/article12/summary?period=1&subject=A680> .

Acrocephalus agricola

Report under the Article 12 of the Birds Directive

ⁱ **Assessment of status at the European level:** The EU assessments of birds population status was made by the European Red List of Birds Consortium (under contract with the European Commission)

The EU27 population trends were assessed using these categories: '+' Increasing, '0' Stable, 'F' Fluctuating, '-' Decreasing, 'xu' Uncertain and 'x' Unknown. The breeding population size is estimated in majority of the cases as 'p' number of pairs. Alternative population units used are: 'males' number of males, 'i' number of individuals, 'cmales' number of calling males and 'bfem' number of breeding females. The winter population size is estimated as number of individuals.

ⁱⁱ **Species trends at the Member State level:** The percentage of the EU27 species population occurring in the Member States (% in EU27) is calculated based on the population size reported by the Member States.
