

## *Anthus cervinus*

---

<b>Annex I</b>	No
<b>International action plan</b>	No

Red-throated Pipit, *Anthus cervinus*, is a species of passerine bird in the wagtail and pipit family found in heathland and shrub and wetland ecosystems. It is a widespread summer visitor to northern Fennoscandia and Russia. This species breeds in the arctic tundra. It favours willow (*Salix*) mires with small creeks, sedge (*Carex*) marshes and peat mounds, both above the treeline and in the mountain birch (*Betula*) forest (European Red List 2015).

*Anthus cervinus* has a breeding population size of 1000-2600 pairs and a breeding range size of 12000 square kilometres in the EU27. The breeding population trend in the EU27 is Unknown in the short term and Decreasing in the long term.

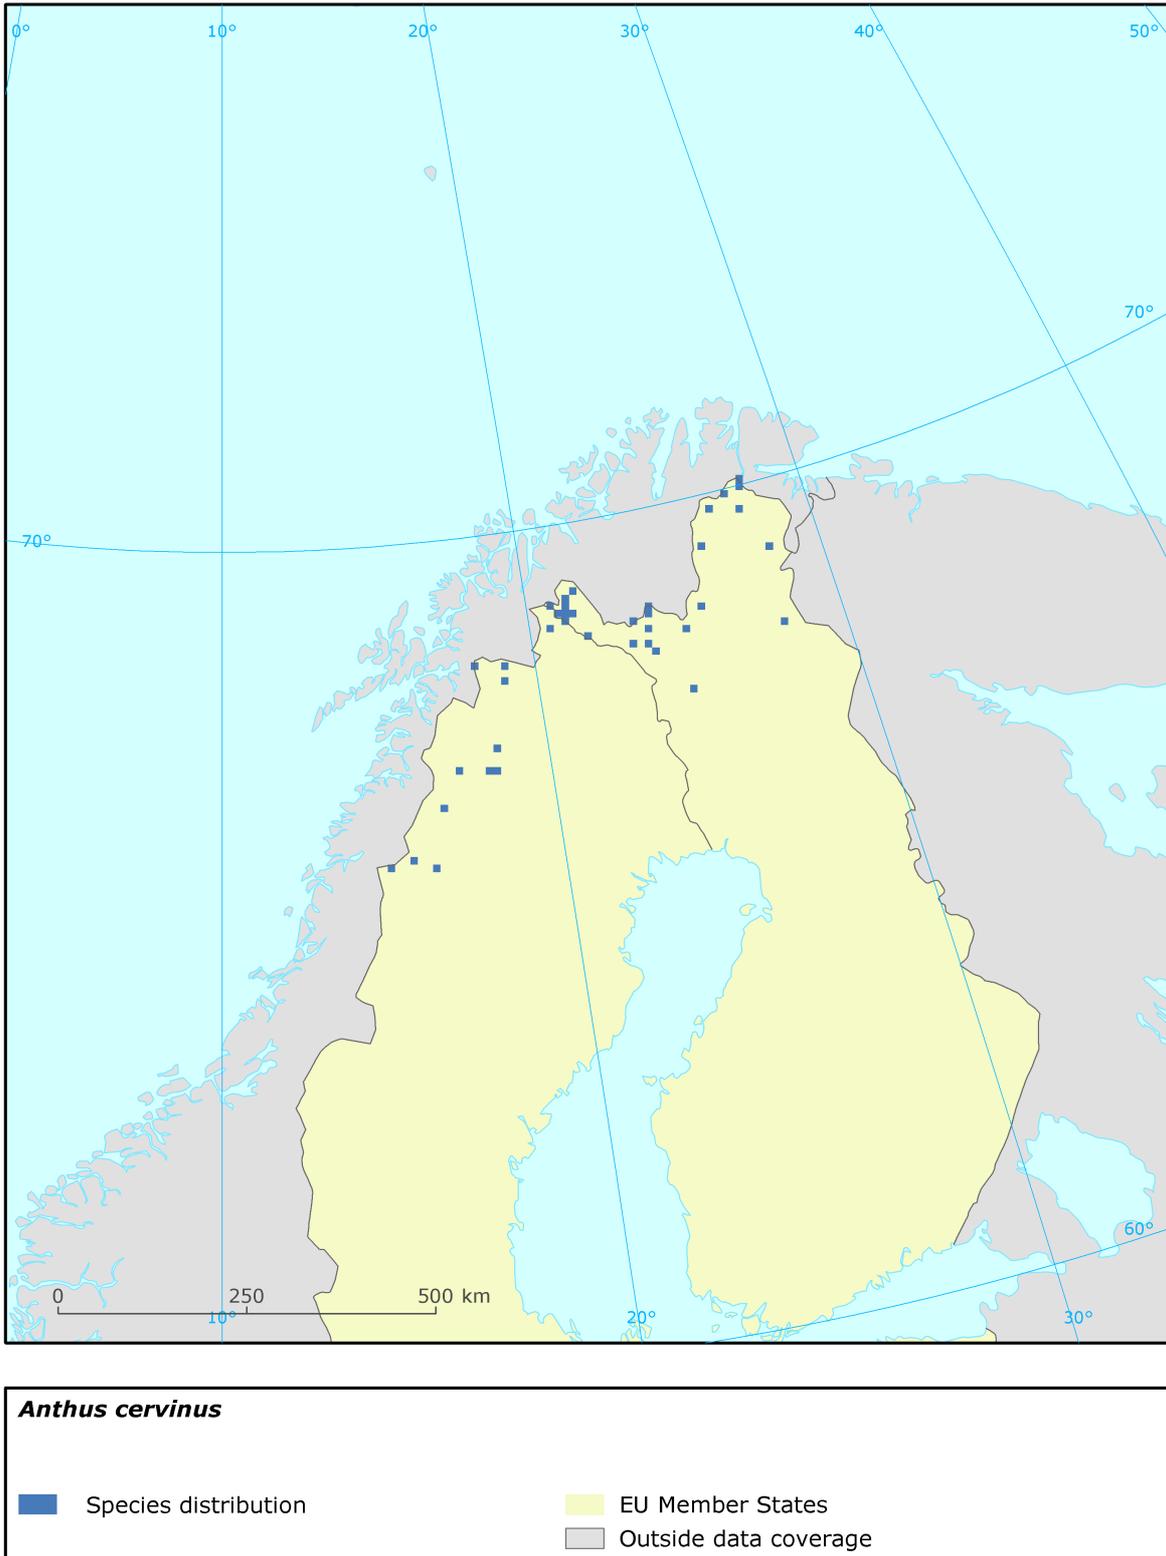

The EU population status for *Anthus cervinus* is Unknown, as the data reported were not sufficient to assess the population status of the species.

## Assessment of status at the European level

Breeding population size	Breeding population trend		Range area	Breeding range trend		Winter population size	Winter population trend		Population status
	Short term	Long term		Short term	Long term		Short term	Long term	
1000 - 2600 p	x	-	12000						Unknown

See the endnotes for more information<sup>i</sup>

Report under the Article 12 of the Birds Directive

## *Anthus cervinus*

Short-term breeding population trend

## ***Anthus cervinus***

*Report under the Article 12 of the Birds Directive*

*Short-term winter population trend was not reported for this species.*

This information is derived from the Member State national reports submitted to the European Commission under Article 12 of the Birds Directive in 2013 and covering the period 2008-2012. More detailed information, including the MS reports, is available at:  
<http://bd.eionet.europa.eu/article12/summary?period=1&subject=A258> .

<sup>i</sup> **Assessment of status at the European level:** The EU assessments of birds population status was made by the European Red List of Birds Consortium (under contract with the European Commission)

The EU27 population trends were assessed using these categories: '+' Increasing, '0' Stable, 'F' Fluctuating, '-' Decreasing, 'xu' Uncertain and 'x' Unknown. The breeding population size is estimated in majority of the cases as 'p' number of pairs. Alternative population units used are: 'males' number of males, 'i' number of individuals, 'cmales' number of calling males and 'bfem' number of breeding females. The winter population size is estimated as number of individuals.

<sup>ii</sup> **Species trends at the Member State level:** The percentage of the EU27 species population occurring in the Member States (% in EU27) is calculated based on the population size reported by the Member States.
