

Species name: **Algyroides nigropunctatus**  
Annex: **IV**

Species group: **Amphibians & Reptiles**  
Regions: **CON MED**

## Assessments of conservation status at the European level (all biogeographical regions - EU25)

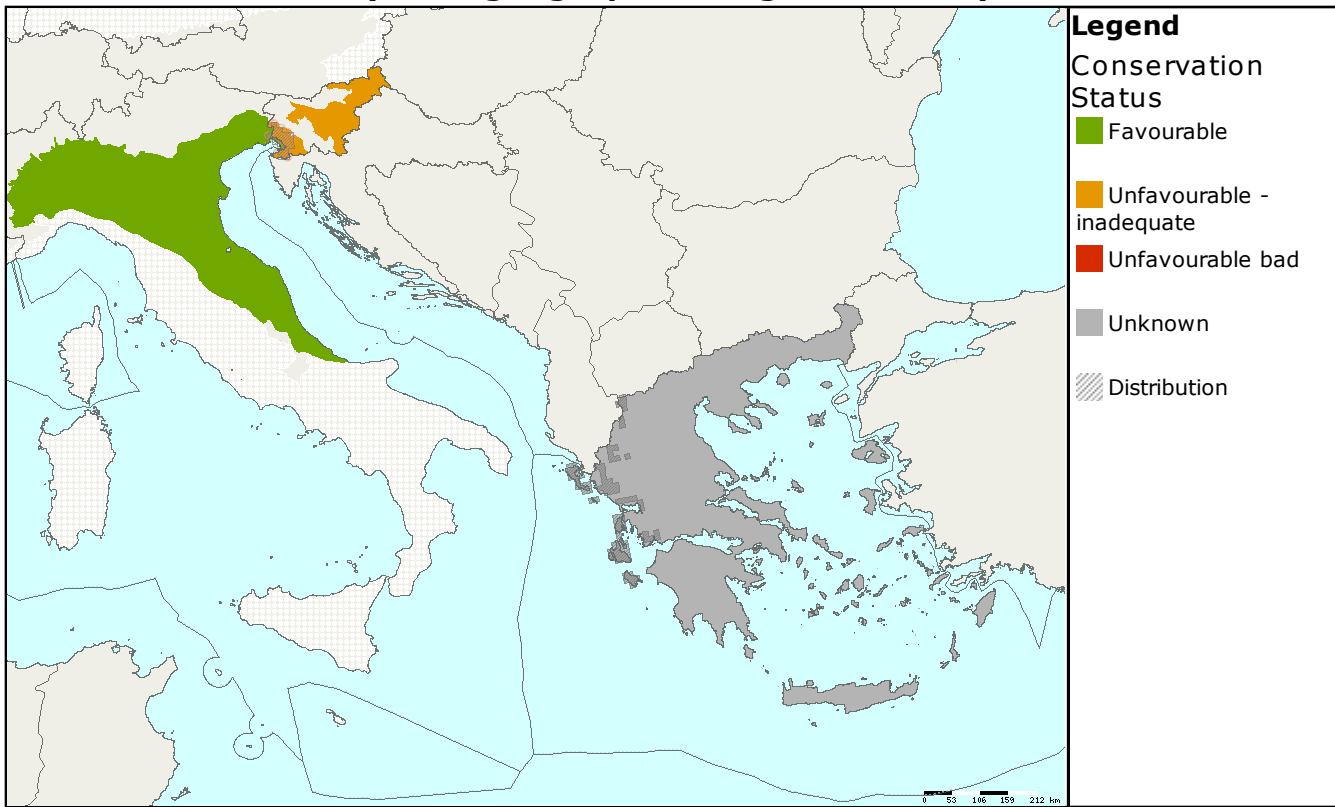

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	CON						22 grids	
EU25	MED							X

The Dalmatian algyroides is found along the western coast of the Balkan Peninsula. Its natural range extends to the north towards Slovenia and the north-eastern Italy. This lizard occurs mainly on wet stands, wet rocks and scree in various woodland and shrub formations.

The conservation status of the population on the northern margin of the natural distribution, in the Continental biogeographical region is 'unfavourable inadequate'. The status in the Mediterranean region is 'unknown' and very little information is available.

## Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
IT	CON						5 - 11 grids	=	1
SI	CON						N/A x	X	3
EL	MED						79 - 79 grids	X	3

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
