

Species name: **Chondrostoma toxostoma**
Annex: **II**

Species group: **Fish**
Regions: **ALP ATL CON MED**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

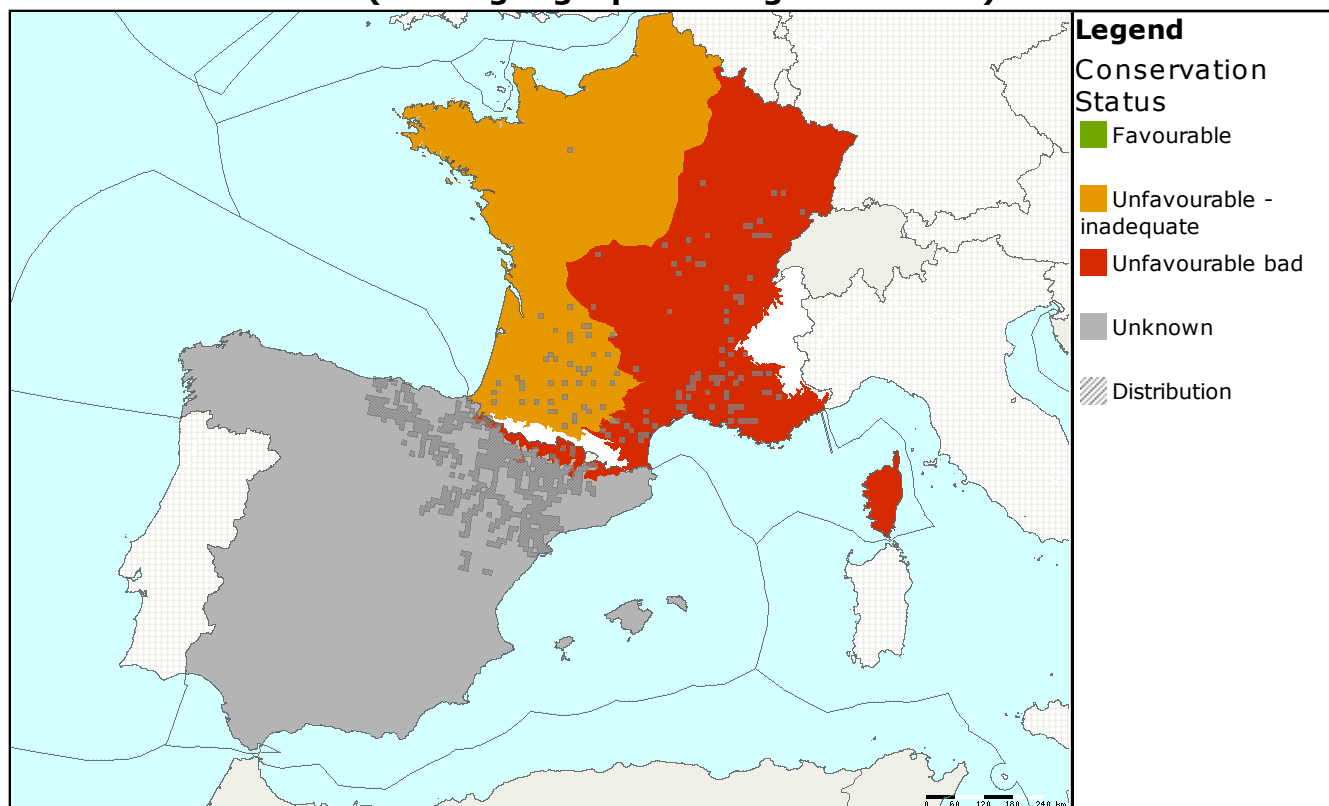

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						1400 loc.	X
EU25	CON							-
EU25	ATL						40 loc.	
EU25	MED						341 loc.	

The South-west European nase is a fish species which is native to France and Switzerland. It has a preference for lower parts of rivers where it inhabits the small streams with clear water and pebble-gravel substrate.

In the Alpine and Continental region the status of this species was assessed as ‘bad’. In the Atlantic region it was assessed as ‘unknown but not favourable’ and in the Mediterranean region it was assessed as ‘unknown’. The Spanish data are deficient which complicates the overall assessment. To improve the overall assessment data from Spain are required. It is threatened by the introduction of other species and habitat destruction which is mostly due to water pollution and dam constructions. The population is decreasing and the IUCN conservation status is ‘Vulnerable’.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
ES	ALP						1400 - (1400) loc.	X	3
FR	ALP						N/A x	N/A	
ES	ATL						40 - (40) loc.	X	3
FR	ATL						N/A loc.	=	2
FR	CON						N/A loc.	-	2
ES	MED						341 - 341 loc.	X	
FR	MED						N/A loc.	-	2

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
