The Fenton's wood white is a butterfly that occurs in some Central European countries, of which Slovakia is the most important one. It is dependent on damp meadows in forests and forest edges.

The overall assessments show a 'bad' status for this species in the Alpine and Pannonic region. In the Continental region its status has been assessed as 'inadequate'. Lacking data from Slovakia, which hosts the majority of the population, could improve the assessment for the Pannonic region. This species is considered to be threatened due to the large deterioration of the population during the last decades.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)
