The clouded Apollo is a butterfly species which is spread over Eurasia. It inhabits all European countries and its territory ranges from the Pyrenees to Norway to Central Asia. This butterfly is dependent on woodland clearings and meadows, which are rich in flowers.

In four of the geographical regions (Alpine, Boreal, Continental and Pannonian) this species' status was assessed as 'inadequate'. In the Mediterranean region its status remains 'unknown', mainly to a lack of data from Greece. Only in some regions of Estonia, France, Germany, Latvia and Slovakia this species has a 'favourable' status. Although the clouded Apollo is still very common, numbers appear to be in decline.
