The Jersey tiger moth is a very common species which is widely spread across Europe. It is only absent in the Nordic countries. It has a preference for forest edges and habitats with watery elements, in particular creeks.

This species has 'favourable' status in most of the biogeographical regions (Alpine, Atlantic, Continental and Pannonian). Due to lack of data from Cyprus, Greece and Spain the status in the Mediterranean region is impossible to be assess. The subspecies *Callimorpha quadripunctaria rhodosensis* which is endemic to the island of Rhodes (Greece) is considered to be threatened. Additional data from Cyprus, Greece and Spain would improve the overall assessment.
