

Species name: **Xestia borealis**  
Annex: **II**

Species group: **Invertebrates**  
Regions: **ALP BOR**

## Assessments of conservation status at the European level (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						5 - 15 loc.	X
EU25	BOR						24 grids	

A Euro-Siberian moth species. The populations in Sweden and in the northern Finland represent the western margin of its natural distribution. It inhabits mainly spruce forests and coniferous bog forests.

The conservations status in the Alpine biogeographical region is 'unfavourable bad' and in the Continental biogeographical region 'unfavourable inadequate'. The populations in Sweden, where the conservation status is 'unfavourable bad', are in the marginal position. But the habitat of the species is under the pressure of commercial forestry in both countries.

## Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
SE	ALP						5 - 15 loc.	X	3
FI	BOR						30 - 150 grids	-	2
SE	BOR						2 - 10 loc.	X	3

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
