## Assessments of conservation status at the European level (all biogeographical regions - EU25)

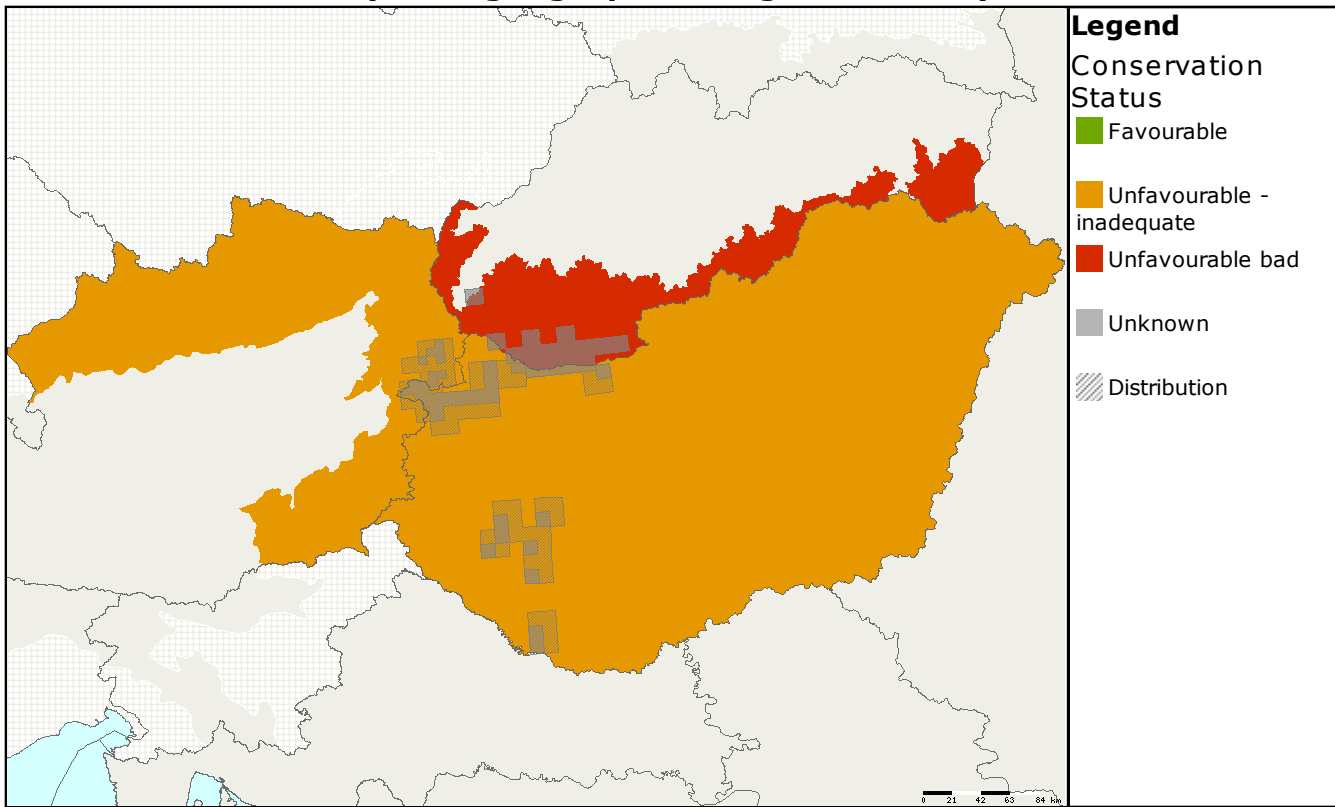

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	CON							X
EU25	PAN						128 - 148 loc.	-

A subspecies of relatively common vole species with circum-boreal distribution is endemic to the Pannonian basin. It occurs in several fragmented localities in Hungary, Slovakia and Austria. It mainly inhabits the formations of tall sedges in eu-littoral zone of lakes, marshes and oxbow lakes and in alluvial meadows.

The conservation status in the Pannonian biogeographical region is 'unfavourable bad'; the range area, the population size and the area of habitat are decreasing and from the long-term perspective they can not be considered sufficient. The negative trends result from the lost of appropriate habitats due to draining, regulation of water courses and eutrophication. The conservation status in the Continental biogeographical region is 'unfavourable inadequate'. Although the trends are stable, the population size and range area are insufficient.

## Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
AT	CON						8 - 8 grids	X	3
HU	PAN						98 - 98 loc.	-	3
SK	PAN						30 - 50 loc.	-	2

Data quality is based on an assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
