

Species name: **Artemisia eriantha**
Annex: **V**

Species group: **Plants**
Regions: **ALP MED**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

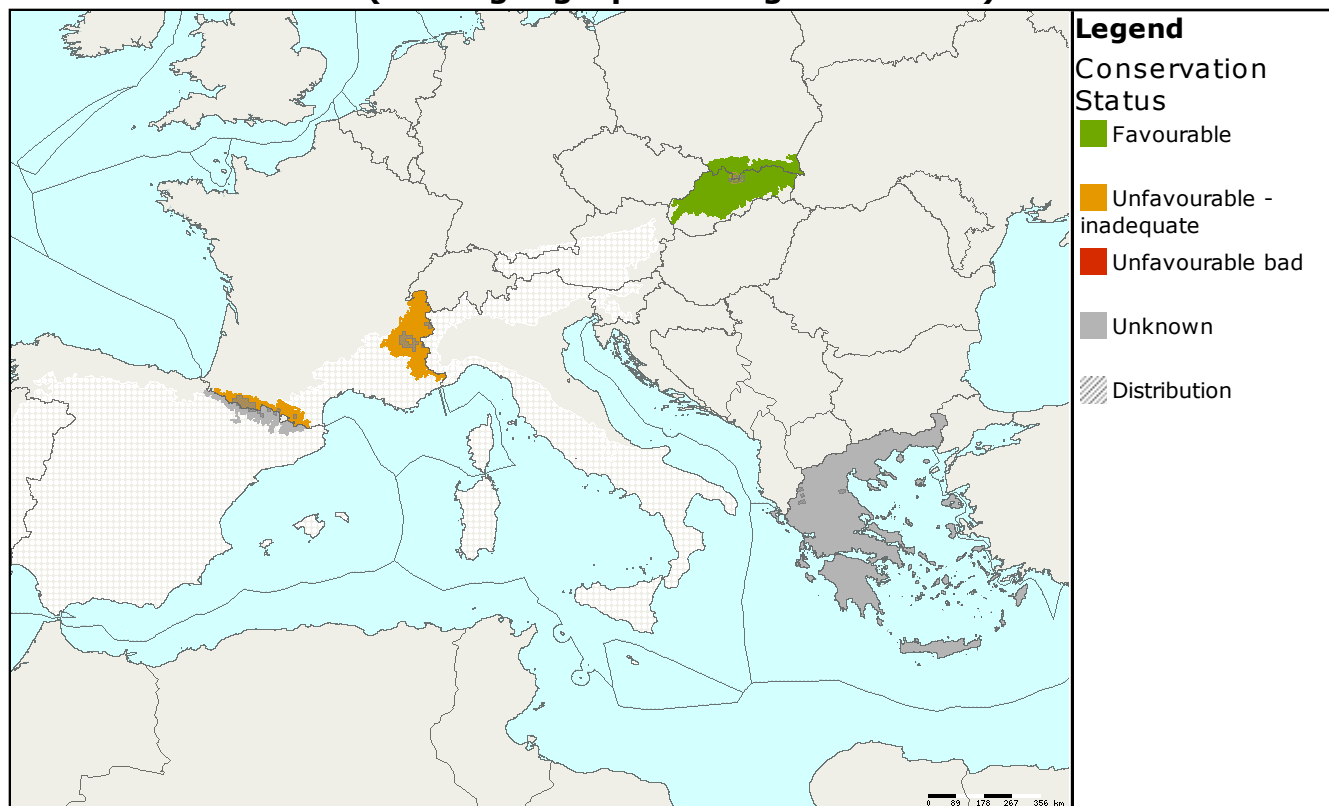

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						57 grids	
EU25	MED							X

A plant species occurring in the high mountains of Western, Central and Southern Europe. Within Europe, apart from countries where it is reported, the species is known from Italy, Romania, Bulgaria and Balkan Peninsula. It occurs on rocks, scree and in the plant communities of rocky slopes on both calcareous and siliceous substrates. It is a species of subalpine zone of the high mountains.

The conservation status in the Alpine biogeographical region is 'unfavourable inadequate'. This reflects the status of the Future prospect of the populations in the western part of the range. The status of the Carpathian population is 'favourable'. In the Mediterranean biogeographical region the conservation status is 'unknown' and the reports for this region are

incomplete. However, the population was assessed as 'unfavourable bad' in Spain.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
ES	ALP						N/A x	N/A	
FR	ALP						88 - 88 x	=	1
PL	ALP						500 - 500 tuffs	=	2
SK	ALP						25 - 25 loc.	=	1
EL	MED						N/A x	X	

Data quality is based on an assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at
