

Species name: **Astragalus centralpinus**  
Annex: **II, IV**

Species group: **Plants**  
Regions: **ALP MED**

## Assessments of conservation status at the European level (all biogeographical regions - EU25)

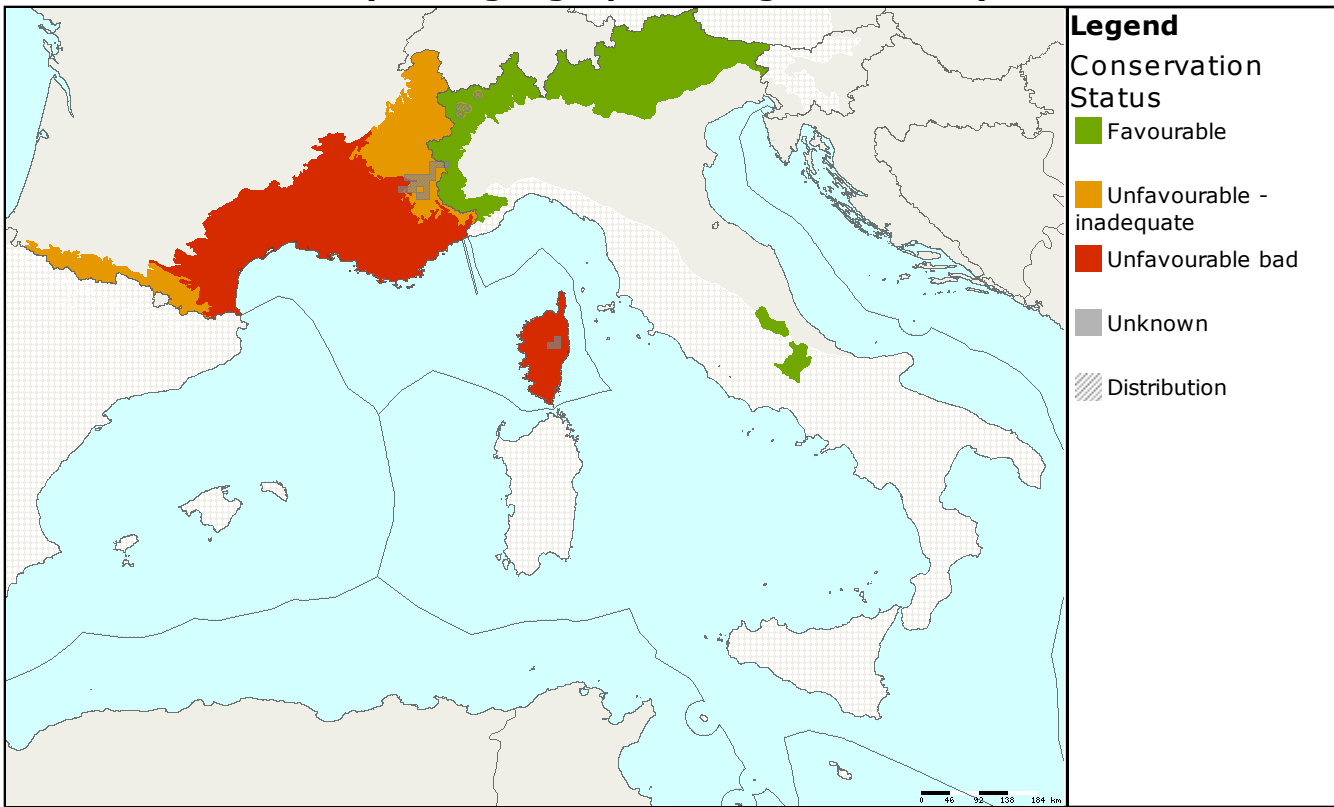

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						22 grids	=
EU25	MED						10 - 60 indiv.	-

A mountain plant species. Its natural range is disjunctive and it is scattered over the Alps, Altai and Caucasus. In Western Europe it occurs in France, Italy and in Bulgaria. In the European part of the range it is a species of dry grasslands and steppic formations of shallow soils on both acidic and calcareous substrates.

The conservation status in the Mediterranean biogeographical region, where the species occurs only on one site in Corse is 'unfavourable bad'. The population size of this restricted and isolated population is too low and still decreasing. The conservation status in the Alpine biogeographical region is 'unfavourable inadequate'. The habitat of species is threatened by succession due to the abandonment of a traditional pastoral use. The conservation status was assessed as 'favourable' in Italy.

## Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
FR	ALP						43 - 43 x	=	1
IT	ALP						6 - 6 loc.	=	2
FR	MED						10 - 60 indiv.	-	1

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
