

Species name: **Ferula sadleriana**
Annex: **II*, IV**

Species group: **Plants**
Regions: **ALP PAN**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						650 - 1400 indiv.	=
EU25	PAN						5000 - 6000 flowr.	=

The distribution of *Ferula sadleriana*, a Pannonian endemic plant species is restricted to the hilly peripheral part of the Pannonian basin. It is known from a few localities in Hungary and Slovakia and from one locality in Romania. It is a species that occurs on dry and warm calcareous cliffs and steep rocky slopes.

The conservation status in both biogeographical regions is 'unfavourable inadequate', in the Alpine biogeographical region it is mainly due to the decrease in the area of the habitat. Population size has stabilised due to a reintroduction programme. On the other hand in the Pannonian biogeographical region the 'unfavourable' status is linked to the population size and deterioration of the habitat by game.

**Assessments of conservation status as reported by Member states
(all biogeographical regions - EU25)**

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
SK	ALP						650 - 1400 indiv.	=	1
HU	PAN						5000 - 6000 flowr.	=	1

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at
