

Species name: **Jurinea cyanoides**
Annex: **II*, IV**

Species group: **Plants**
Regions: **ATL CON**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

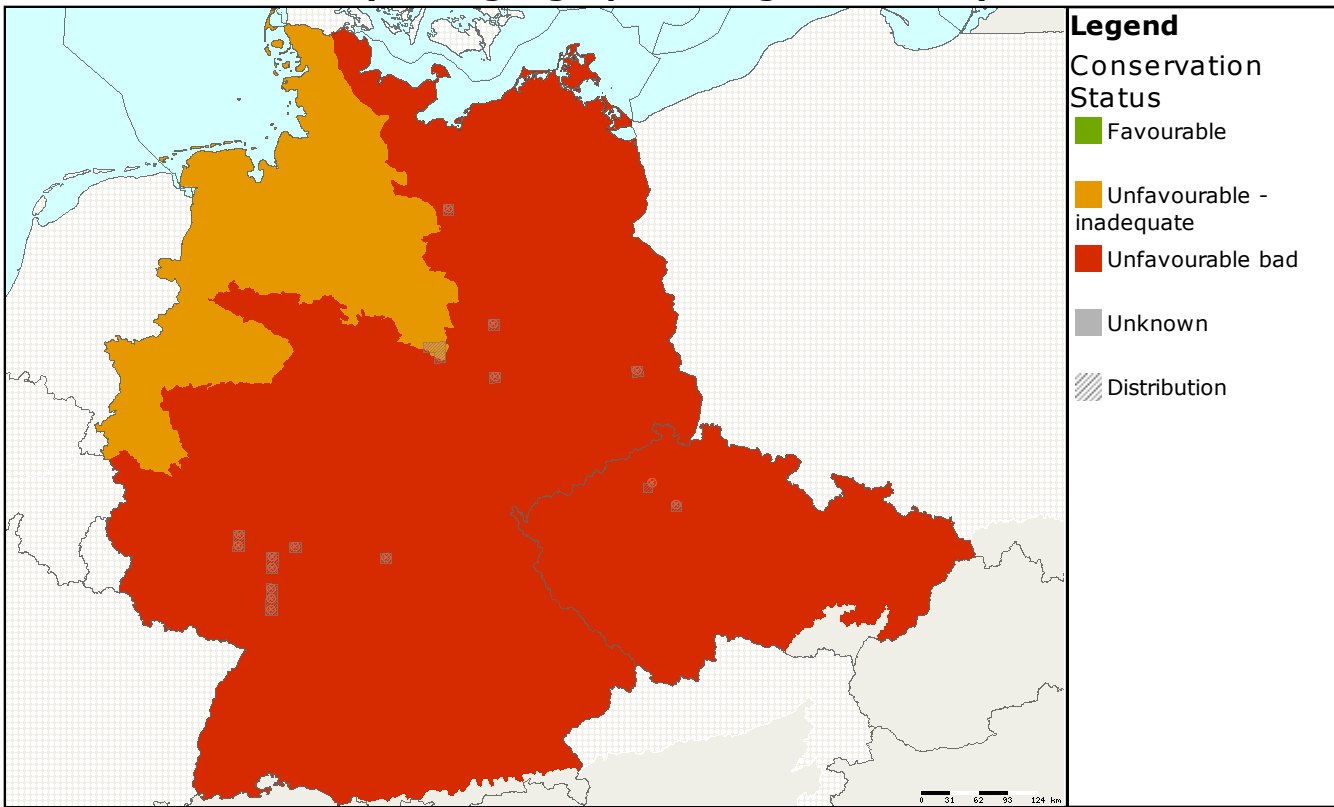

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ATL						13 loc.	-
EU25	CON						22 grids	-

The centre of the natural distribution of this plant species lies further towards the east and it borders Belarus, Ukraine, Russia, to the south it extends towards the Caucasus and Altai mountains. Isolated localities in central Europe (in Germany and Czech Republic) are of relict origin. It can be found on sand dunes, in the dry heaths and grasslands on sandy substrate. As it is a weak competitor it requires constant disturbance of the substrate.

The conservation status in the Atlantic biogeographical region is 'unfavourable inadequate' and in Continental 'unfavourable bad'. The major threat is the loss of natural habitat as this species responds sensitively to the succession and the habitats are dependant on constant management. Atmospheric pollution by nitrogenous compounds facilitates these processes.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
DE	ATL						13 - (13) loc.	-	2
CZ	CON						47 - 47 x	-	1
DE	CON						27 - (27) loc.	=	1

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
