

Species name: **Meesia longiseta**
Annex: **II**

Species group: **Plants**
Regions: **ALP BOR CON**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

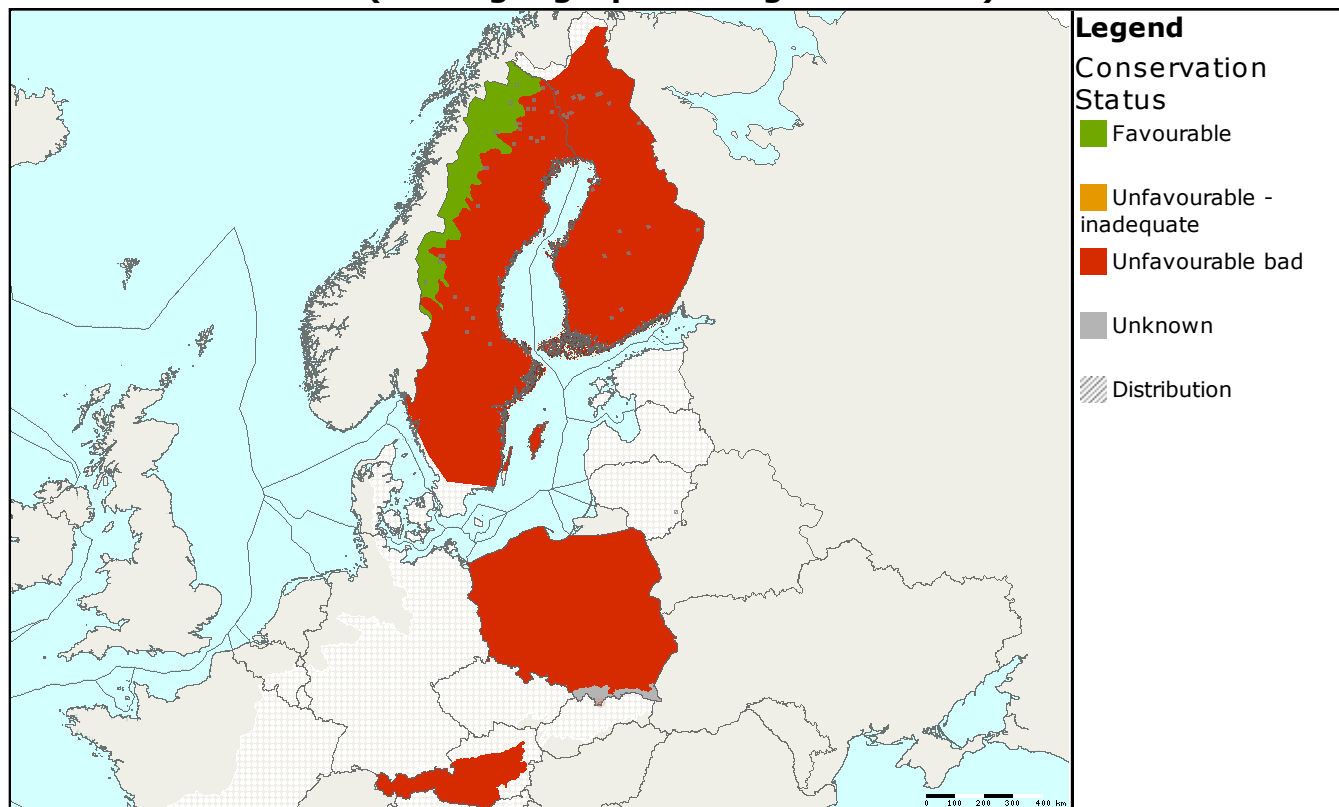

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP	 	 	 	 	 	11 grids	
EU25	BOR	 	 	 	 	 	44 grids	-

A moss species with circum-boreal distribution. The localities in the mountainous region of the Central and Eastern Europe are of relict origin. It can be found in calcareous fens. In the past it occurred scattered through all the Central Europe with most localities in the Alps, but currently it is very rare or extinct in a large part of the continent.

The conservation status in the Alpine biogeographical region, where the major part of the population occurs in Sweden, is 'favourable'. In the Boreal biogeographical region it is 'unfavourable inadequate'; the range area, the population size and the habitat area are decreasing. On the top of that the species persist in small isolated populations and its habitat is further threatened by draining and eutrophication.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
PL	ALP						1 - 1 loc.	X	3
SE	ALP						12 - 12 grids	=	2
AT	ALP						N/A loc.	-	2
FI	BOR						20 - 30 loc.	-	2
SE	BOR						30 - 30 grids	-	2
PL	CON						N/A loc.	-	1

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
