

Species name: **Narcissus juncifolius**
Annex: **V**

Species group: **Plants**
Regions: **ALP MED**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

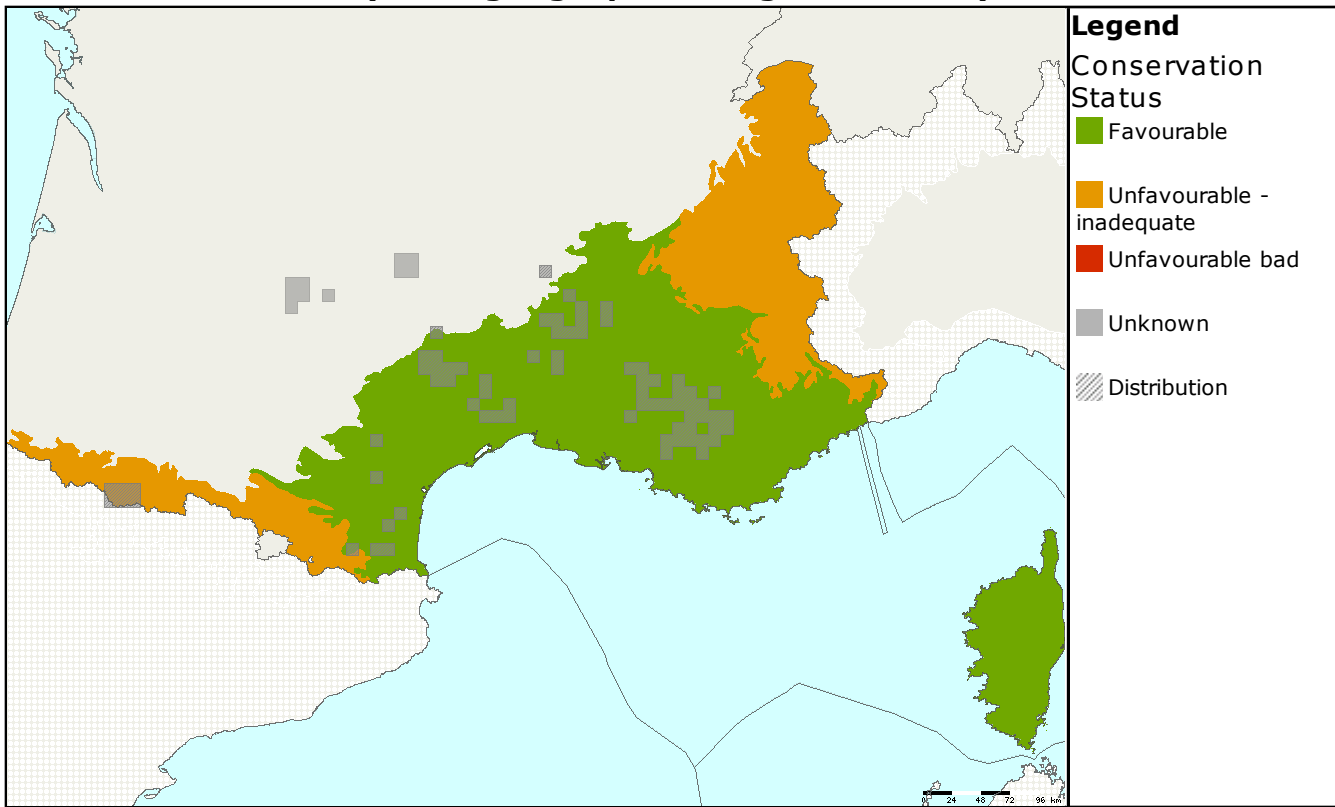

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						2 loc.	-
EU25	MED						77 loc.	=

This species was reported only from France. However it is relatively common in southern France and southern Spain. In France it occurs in upland stony grasslands on calcareous substrate, while in Spain it is a spring component of lowland garrigue and dry calcareous grasslands.

The conservation status in the Alpine biogeographical region is 'unfavourable inadequate' the range area and the population size are decreasing, which is a consequence of the succession changes of the vegetation after an abandonment of pasture. The conservation status in the Mediterranean biogeographical region is 'favourable', but this does not concern the situation in Spain.

**Assessments of conservation status as reported by Member states
(all biogeographical regions - EU25)**

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
FR	ALP						2 - 2 loc.	-	1
FR	MED						77 - 77 loc.	=	3

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at
