

Species name: **Ranunculus lapponicus**
Annex: **II, IV**

Species group: **Plants**
Regions: **ALP BOR**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ALP						49 grids	=
EU25	BOR						860 grids	=

A plant species with circumpolar distribution occurring in the northern part of Eurasia and North America. In Western Europe it is found commonly in Northern Sweden, Norway and Finland. It is a species of mostly coniferous forest of bogs and swamps.

The conservation status is 'favourable' in both the Alpine and the Boreal biogeographical regions. The population size and the range are stable; no major threats to the habitat or the population were recorded. However inappropriate forest practices and draining of the localities may represent a potential threat to this forest species.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
FI	ALP						50 - (50) grids	=	3
SE	ALP						5000 - 5000 flowr.	=	2
FI	BOR						573 - (573) grids	=	3
SE	BOR						1000000 - 1000000 flowr.	=	2

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
