

Species name: **Rumex rupestris**
Annex: **II, IV**

Species group: **Plants**
Regions: **ATL**

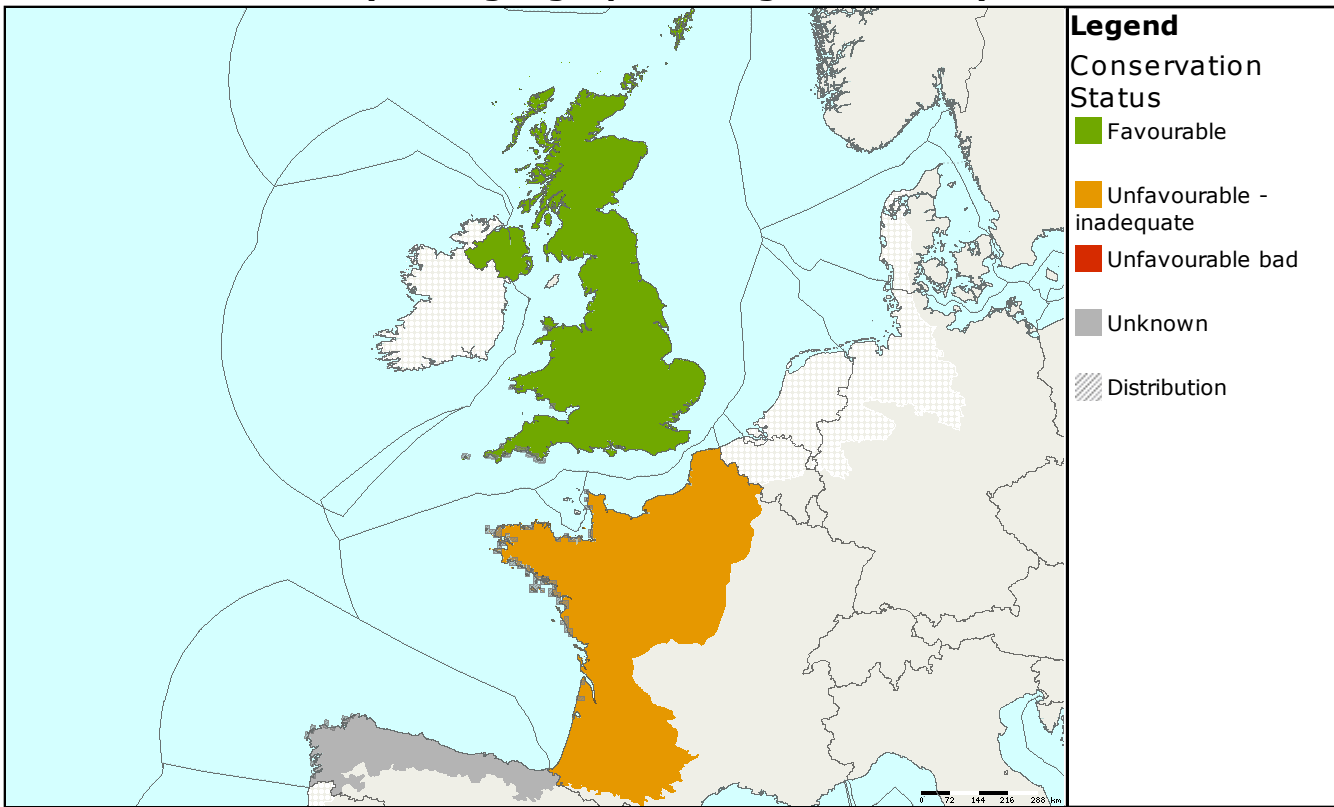

Assessments of conservation status at the European level (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ATL						111 grids	=

The shore dock (*Rumex rupestris*) is a plant growing on upper shores or in wet hollows in sand dunes. It is endemic to coastal regions of south-west Great Britain, western France and north western Spain (Atlantic region). Little information is reported by Spain, but excluding Spain from the regional assessment does not alter the overall assessment. Overall regional assessment is 'unfavourable-inadequate' due to poor habitat and future prospects in France. In the United Kingdom the species is considered 'favourable'. Species is noted as 'endangered' in Spanish Red Data Book.

**Assessments of conservation status as reported by Member states
(all biogeographical regions - EU25)**

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
ES	ATL						12 - (12) loc.	-	1
FR	ATL						76 - 76 loc.	=	1
UK	ATL						220 - 250 x	-	2

Data quality is based on as assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
