

Species name: **Scrophularia herminii**
Annex: **V**

Species group: **Plants**
Regions: **ATL MED**

Assessments of conservation status at the European level (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Population size & unit	Population Trend
		Range	Population	Habitat	Future prospects	Overall		
EU25	ATL						13 grids	
EU25	MED						23 grids	

A plant species endemic to north-western Iberian Peninsula being reported by both Spain and Portugal. It is a species of nitrophilous communities of humid, shaded stands and can be found in the fringe communities of streams, on stabilised scree, humid rocks and in secondary plant communities.

The reports for this, in general very poorly known, species are incomplete. The conservation status was not assessed at the national level in Portugal although the range, the population size and the habitat area are decreasing. The completeness of the data does not allow for the other than 'unknown' conclusion for both the Atlantic and the Mediterranean biogeographical regions.

Assessments of conservation status as reported by Member states (all biogeographical regions - EU25)

MS	Region	Conservation status assessment					Size&unit	Population trend	Data quality
		Range	Population	Habitat	Future prospects	Overall			
ES	ATL						9 - (9) loc.	=	1
PT	ATL						N/A x	X	
ES	MED						19 - (19) loc.	N/A	1
PT	MED						N/A x	X	

Data quality is based on an assessment by each Member State, 1 = good, 2 = medium, 3 = poor

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2007 and covering the period 2001-2006. More detailed information is available at <http://biodiversity.eionet.europa.eu/article17>
