

## Pytho kolwensis

---

<b>Annex</b>	II, IV
<b>Priority</b>	No
<b>Species group</b>	Arthropods
<b>Regions</b>	Boreal, Continental

The beetle *Pytho kolwensis* is a taiga species; its distribution extends from Sweden through Finland, Estonia, easternmost Poland and Russian Karelia to the Russian far east. Its habitats are virgin spruce-mire forests with a stand continuity of at least 170–300 years, and a high volume of dead wood where inhabits fallen spruce trunks.

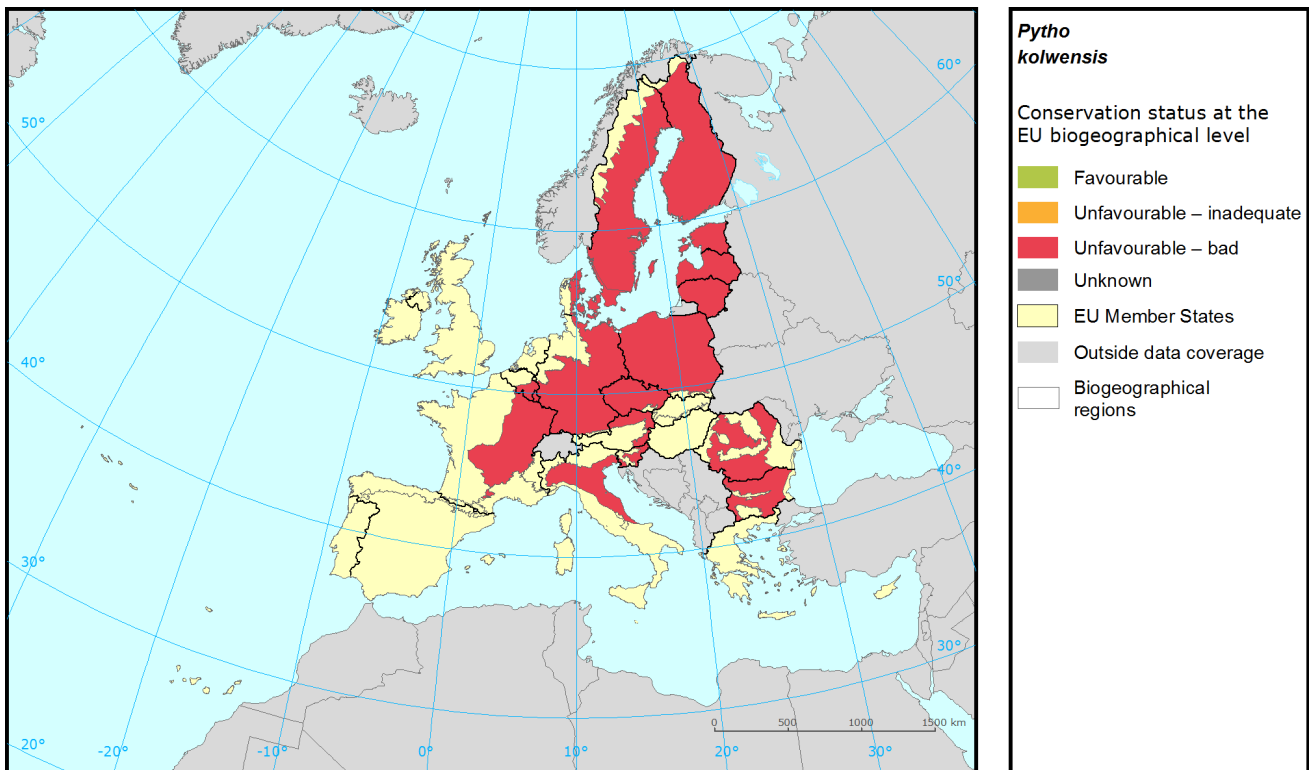

It is assessed as unfavourable-bad for the Boreal region. It was the same in the previous reporting round. Sweden from the Boreal region reported these major threats and pressures: forest and plantation management and use, forestry activities not referred to above, reduction or loss of specific habitat features and anthropogenic reduction of habitat connectivity.

In the Continental region this species is reported only from Poland. The conservation status is reported as unfavourable-bad similarly as in the previous reporting round. Poland reports no pressure and threat.

# Species: *Pytho kolwensis*

Report under the Article 17 of the Habitats Directive

## Assessment of conservation status at the European biogeographical level

Region	Conservation status (CS) of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
	Range	Population	Habitat	Future prospects					
BOR	U2	U2	U2	U2	U2	-	97	U2	
CON	U2	XX	U2	U1	U2	x	3	U2	

See the endnote for more information<sup>i</sup>

# Species: *Pytho kolwensis*

Report under the Article 17 of the Habitats Directive

## Assessment of conservation status at the Member State level

### *Pytho kolwensis*

Distribution and conservation status at the Member State level

- |                           |                        |
|---------------------------|------------------------|
| Favourable                | EU Member States       |
| Unfavourable – inadequate | Outside data coverage  |
| Unfavourable – bad        | Biogeographical region |
| Unknown                   |                        |

The map shows both Conservation Status and distribution using a 10 km x 10 km grid. Conservation status is assessed at biogeographical level. Therefore the representation in each grid cell is only illustrative.

# Species: *Pytho kolwensis*

Report under the Article 17 of the Habitats Directive

MS Region	Conservation status of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
	Range	Population	Habitat	Future prospects					
FI BOR	U1	U1	U1	U1	U1	=	62.2	U1-	Changed method
SE BOR	U2	U2	U2	U2	U2	-	37.8	U2-	
PL CON	U2	XX	U2	U1	U2	x	100.0	U2	

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

## Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the [Article 17 Reference Portal](#). Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

### Ten most frequently reported 'highly important' pressures

Code	Activity	Frequency
B02	Forest and plantation management & use	33
B07	Other forestry activities	33
J03	Other changes to ecosystems	33

### Ten most frequently reported 'highly important' threats

Code	Activity	Frequency
B02	Forest and plantation management & use	33
B07	Other forestry activities	33
J03	Other changes to ecosystems	33

# Species: *Pytho kolwensis*

Report under the Article 17 of the Habitats Directive

## Proportion of population covered by the Natura 2000 network

For species listed in the Annex II of the Directive Member States were asked to report the population size within the Natura 2000 network. The percentage of species population covered by the network was estimated by comparing the population size within the network and the total population size in the biogeographical/marine region.

### Percentage of coverage by Natura 2000 sites in biogeographical/marine region

	BOR	CON
FI	90	
PL		100
SE	72	

See the endnotes for more information<sup>ii</sup>

## Most frequently reported conservation measures

For species listed in the Annex II of the Directive Member States were asked to report up to 20 conservation measures being implemented for this species using an agreed list which can be found on the Article 17 Reference Portal. Member States were further requested to highlight up to five most important ('highly important') measures; the table below only shows measures classed as 'high', for many species there were less than ten measures reported as highly important.

### Ten most frequently reported 'highly important' conservation measures

Code	Measure	Frequency
6.1	Establish protected areas/sites	50
3.0	Other forestry-related measures	25
3.1	Restoring/improving forest habitats	25

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at:

<http://bd.eionet.europa.eu/article17/reports2012/species/summary/?group=Arthropods&period=3&subject=Pytho+kolwensis>

# Species: *Pytho kolwensis*

Report under the Article 17 of the Habitats Directive

**i Assessment of conservation status at the European biogeographical level:** Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.

**ii Percentage of coverage by Natura 2000 sites in biogeographical/marine region:** In some cases the population size within the Natura 2000 network has been estimated using a different methodology to the estimate of overall population size and this can lead to percentage covers greater than 100%. In such case the value has been given as 100% and highlighted with an asterisk (\*). The value 'x' indicates that the Member State has not reported the species population and/or the coverage by Natura 2000. No information is available for Greece. The values are only provided for regions, in which the occurrence of the species has been reported by the Member States.
