

Microtus cabraerae

Annex	II, IV
Priority	No
Species group	Mammals
Regions	Mediterranean

The Cabrera's Vole is endemic to the Iberian Peninsula (Portugal and Spain) where its range is fragmented. It occurs in pastures, fields and open clearings in woodland.

The conservation status is Unfavourable-Bad with decreasing trend in conservation status. Previously the status was most likely Unfavourable-Bad as well (both countries indicate methodological changes). Trends in parameters show decrease in Spain (according to Spain a new survey which was not yet finished before the end of the reporting period, indicated already losses of known colonies). Difficult to draw conclusions on Portugese data as they are largely unknown.

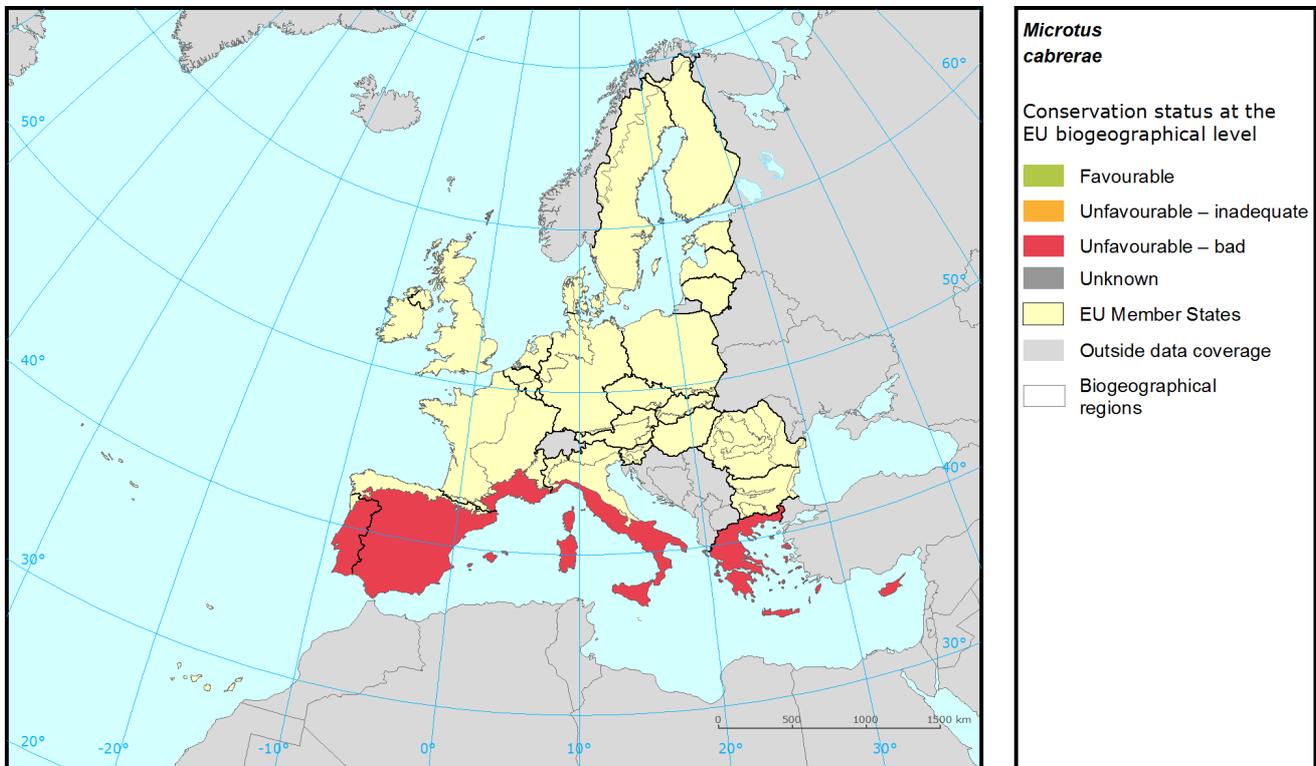

The very high number of threats and pressures of high importance supports the bad conservation status in both countries (agricultural intensification, grazing, roads and motorways, droughts, burning, changing grassland to arable land, water abstraction from surface waters and anthropogenic reduction of habitat connectivity.)

This species is assessed as Near Threatened by IUCN.

Species: *Microtus cabrerae*

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the European biogeographical level

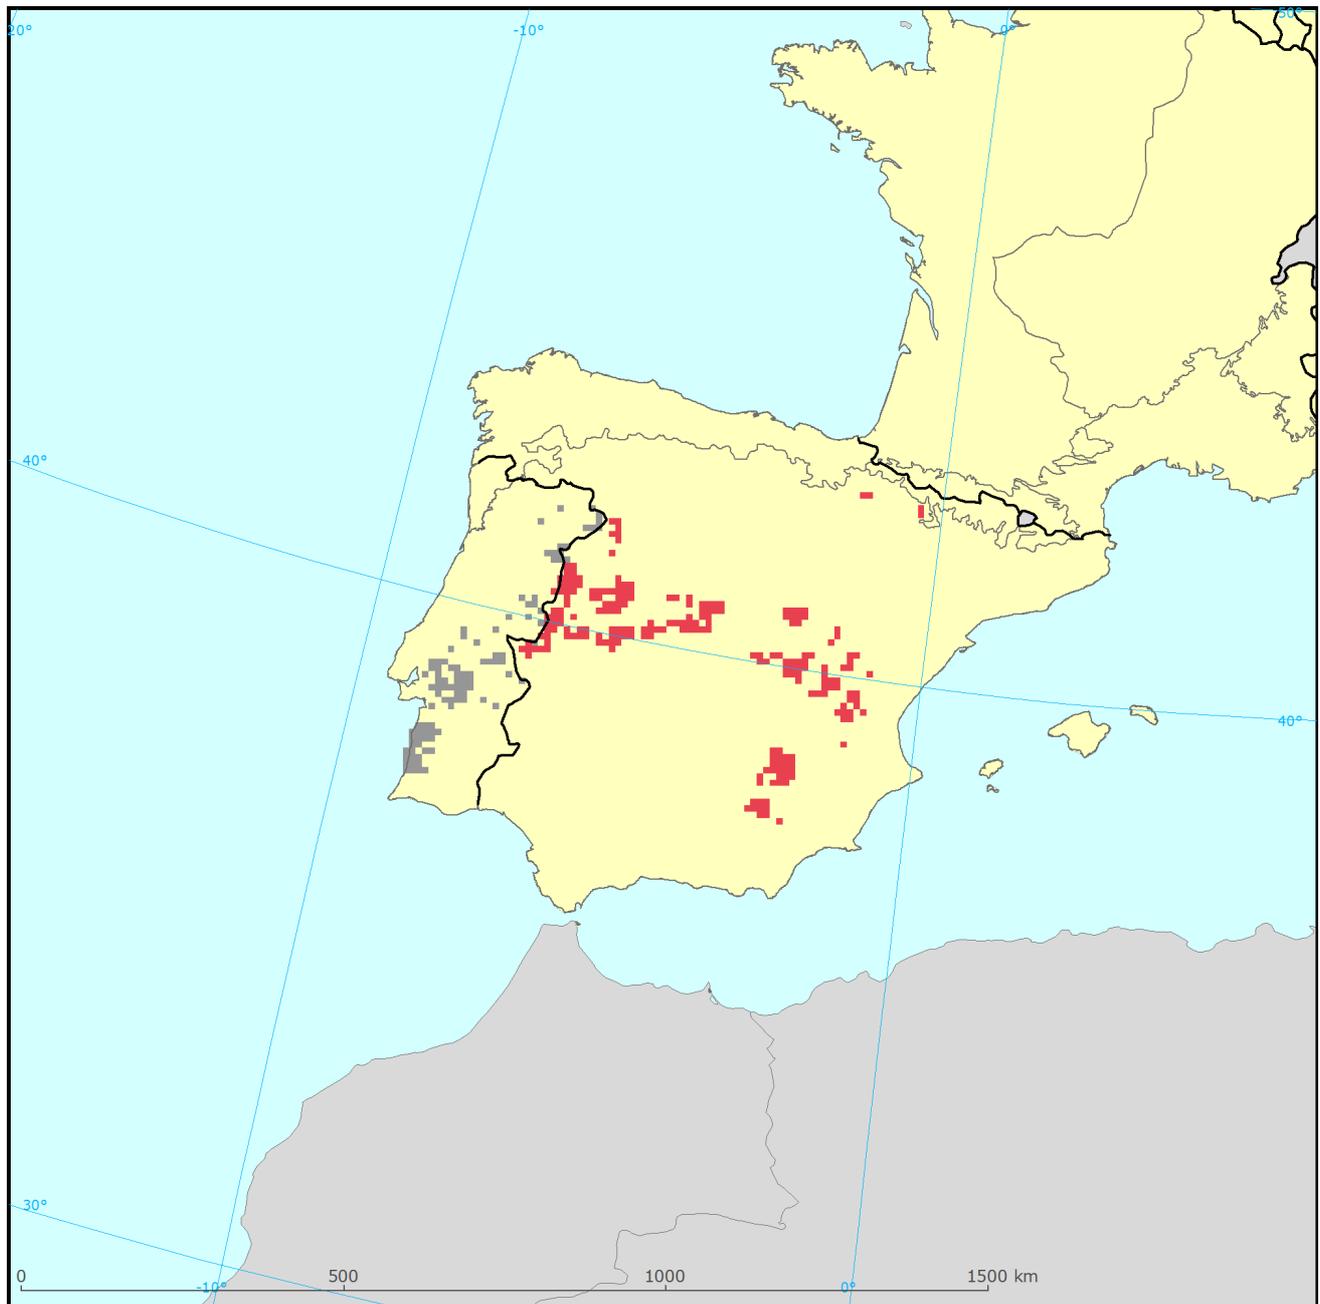

Region	Conservation status (CS) of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
	Range	Population	Habitat	Future prospects

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the Member State level

Microtus cabreræ

Distribution and conservation status at the Member State level

- | | |
|---|--|
|  Favourable |  EU Member States |
|  Unfavourable – inadequate |  Outside data coverage |
|  Unfavourable – bad |  Biogeographical region |
|  Unknown | |

The map shows both Conservation Status and distribution using a 10 km x 10 km grid. Conservation status is assessed at biogeographical level. Therefore the representation in each grid cell is only illustrative.

Species: *Microtus cabrerar*

Report under the Article 17 of the Habitats Directive

MS	Region	Conservation status of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
		Range	Population	Habitat	Future prospects					
ES	MED	U1	U2	U2	U2	-	68.9	XX	Changed method	
PT	MED	FV	XX	XX	XX		31.1	U1	Changed method	

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the [Article 17 Reference Portal](#). Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

Ten most frequently reported 'highly important' pressures

Code	Activity	Frequency
A02	Modification of cultivation practices	25
A04	Grazing by livestock	25
J01	Fire and fire suppression	25
D01	Roads, railroads and paths	13
J03	Other changes to ecosystems	13

Ten most frequently reported 'highly important' threats

Code	Activity	Frequency
A02	Modification of cultivation practices	22
A04	Grazing by livestock	22
D01	Roads, railroads and paths	11
J01	Fire and fire suppression	11
J02	Changes in water bodies conditions	11
J03	Other changes to ecosystems	11
M01	Abiotic changes (climate change)	11

Species: *Microtus cabrerae*

Report under the Article 17 of the Habitats Directive

Proportion of population covered by the Natura 2000 network

For species listed in the Annex II of the Directive Member States were asked to report the population size within the Natura 2000 network. The percentage of species population covered by the network was estimated by comparing the population size within the network and the total population size in the biogeographical/marine region.

Percentage of coverage by Natura 2000 sites in biogeographical/marine region

See the endnotes for more informationⁱⁱ

Most frequently reported conservation measures

For species listed in the Annex II of the Directive Member States were asked to report up to 20 conservation measures being implemented for this species using an agreed list which can be found on the Article 17 Reference Portal. Member States were further requested to highlight up to five most important ('highly important') measures; the table below only shows measures classed as 'high', for many species there were less than ten measures reported as highly important.

Ten most frequently reported 'highly important' conservation measures

Code	Measure	Frequency
2.1	Maintaining grasslands and other open habitats	17
2.2	Adapting crop production	17
3.1	Restoring/improving forest habitats	17
6.1	Establish protected areas/sites	17
6.3	Legal protection of habitats and species	17
8.2	Specific management of traffic and energy transport systems	17

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at:

Species: *Microtus cabrerae*

Report under the Article 17 of the Habitats Directive

i Assessment of conservation status at the European biogeographical level: Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.

ii Percentage of coverage by Natura 2000 sites in biogeographical/marine region: In some cases the population size within the Natura 2000 network has been estimated using a different methodology to the estimate of overall population size and this can lead to percentage covers greater than 100%. In such case the value has been given as 100% and highlighted with an asterisk (*). The value 'x' indicates that the Member State has not reported the species population and/or the coverage by Natura 2000. No information is available for Greece. The values are only provided for regions, in which the occurrence of the species has been reported by the Member States.
