Report under the Article 17 of the Habitats Directive Period 2007-2012

# **European Environment Agency** *European Topic Centre on Biological Diversity*

## Lampedusa imitatrix

**Annex** II, IV **Priority** No

Species group Molluscs

**Regions** Mediterranean

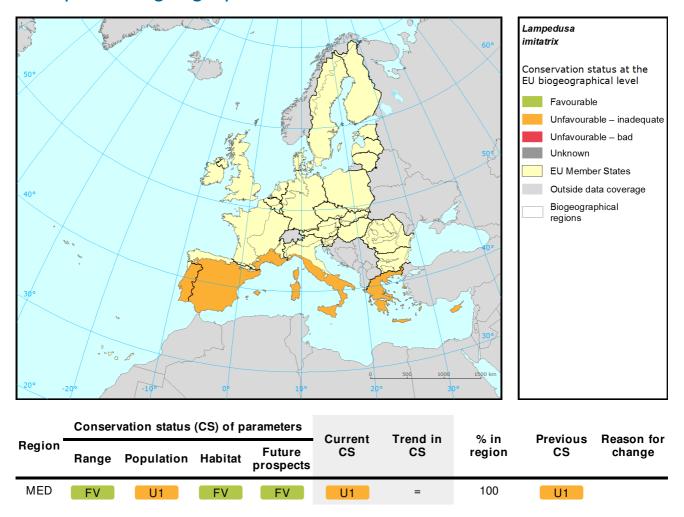

Lampedusa imitatrix is an endemic snail species to Malta. Its distribution is very restricted: it is found in the western region of the Maltese coastal cliffs in the Mtahleb-Fomm ir-Rih area (as the type species) and the island of Filfla (potentially as L. imitatrix gattoi). The favourable range and area of this species is limited to such localities due to the occurrence of the related Lampedusa melitensis and Muticaria macrostoma (both endemic to the Maltese Islands) along the Maltese cliffs. These three endemic species probably originated due to different isolation episodes following connections and separations with Sicily during the Pliocene/Pleistocene period. It is postulated that each of these species possibly replaced the others, thus rendering coexistence difficult.

Its overall assessment is unfavourable-inadequate but stable. In the previous reporting round it was also unfavourable-inadequate.

Competition between species is reported as a pressure and threat of a high importance. In addition reduced fecundity/genetic depression is reported as a threat of high importance. The species is assessed as Endangered by the IUCN (IUCN makes also a remark that covering habitats by top-soil to reclaim the land for agriculture is a threat to this species).

Report under the Article 17 of the Habitats Directive

## Assessment of conservation status at the European biogeographical level

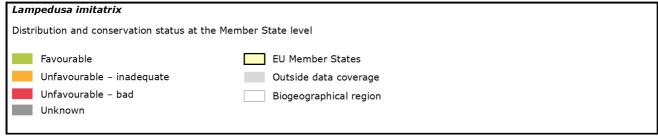

See the endnote for more information<sup>i</sup>

#### Report under the Article 17 of the Habitats Directive

#### Assessment of conservation status at the Member State level

The map shows both Conservation Status and distribution using a 10 km x 10 km grid. Conservation status is assessed at biogeographical level. Therefore the representation in each grid cell is only illustrative.

Report under the Article 17 of the Habitats Directive

_	Conservation status of parameters				Current	Trand in	% in	Previous	Reason
MS Region	Range	Population	Habitat	Future prospects	Current CS	Trend in CS	region	CS	for change
MT MED	FV	U1	FV	FV	U1	=	100.0	U1	

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

## Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the Article 17 Reference Portal. Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

#### Ten most frequently reported 'highly important' pressures

Code	Activity	Frequency
K03	Interspecific faunal relations	100

#### Ten most frequently reported 'highly important' threats

Code	Activity	Frequency
K03	Interspecific faunal relations	50
K05	Reduced fecundity/Genetic depression	50

### Proportion of population covered by the Natura 2000 network

For species listed in the Annex II of the Directive Member States were asked to report the population size within the Natura 2000 network. The percentage of species population covered by the network was estimated by comparing the population size within the network and the total population size in the biogeographical/marine region.

#### Percentage of coverage by Natura 2000 sites in biogeographical/marine region

See the endnotes for more information ii

Report under the Article 17 of the Habitats Directive

## Most frequently reported conservation measures

For species listed in the Annex II of the Directive Member States were asked to report up to 20 conservation measures being implemented for this species using an agreed list which can be found on the Article 17 Reference Portal. Member States were further requested to highlight up to five most important ('highly important') measures; the table below only shows measures classed as 'high', for many species there were less than ten measures reported as highly important.

#### Ten most frequently reported 'highly important' conservation measures

Code	Measure	Frequency
6.1	Establish protected areas/sites	33
6.3	Legal protection of habitats and species	33
7.1	Regulation/ Management of hunting and taking	33

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at: http://bd.eionet.europa.eu/article17/reports2012/species/summary/? group=Molluscs&period=3&subject=Lampedusa+imitatrix

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the European biogeographical level: Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.

iiPercentage of coverage by Natura 2000 sites in biogeographical/marine region: In some cases the population size within the Natura 2000 network has been estimated using a different methodology to the estimate of overall population size and this can lead to percentage covers greater than 100%. In such case the value has been given as 100% and highlighted with an asterisk (\*). The value 'x' indicates that the Member State has not reported the species population and/or the coverage by Natura 2000. No information is available for Greece. The values are only provided for regions, in which the occurrence of the species has been reported by the Member States.
