Report under the Article 17 of the Habitats Directive Period 2007-2012

European Environment Agency *European Topic Centre on Biological Diversity*

Lacerta graeca

Annex IV Priority No

Species group Reptiles

Regions Mediterranean

Lacerta graeca

The Greek rock lizard is found on the Peloponnese Peninsula in southern Greece. It can be found near water sources, humid areas in upland and coastal regions and shaded stands in a variety of habitats, including open forests, hedges and shrub vegetation.

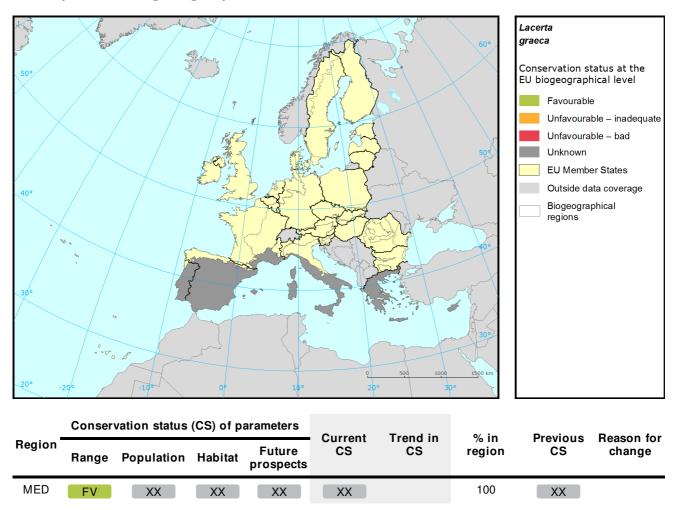

This species was reported in Greece in the Mediterranean biogeographical region. Its conservation status is assessed as 'unknown', which is unchanged from the previous reporting period due to Greece's failure to deliver reports for the current reporting period. Greece did not report pressures or threats for the species.

The IUCN Red List classifies the species as near threatened due to its low extent of occurance and a decline in the extent and quality of its habitat (http://www.iucnredlist.org/details/61523/1 consulted on 25 February 2015).

Species: Lacerta graeca

Report under the Article 17 of the Habitats Directive

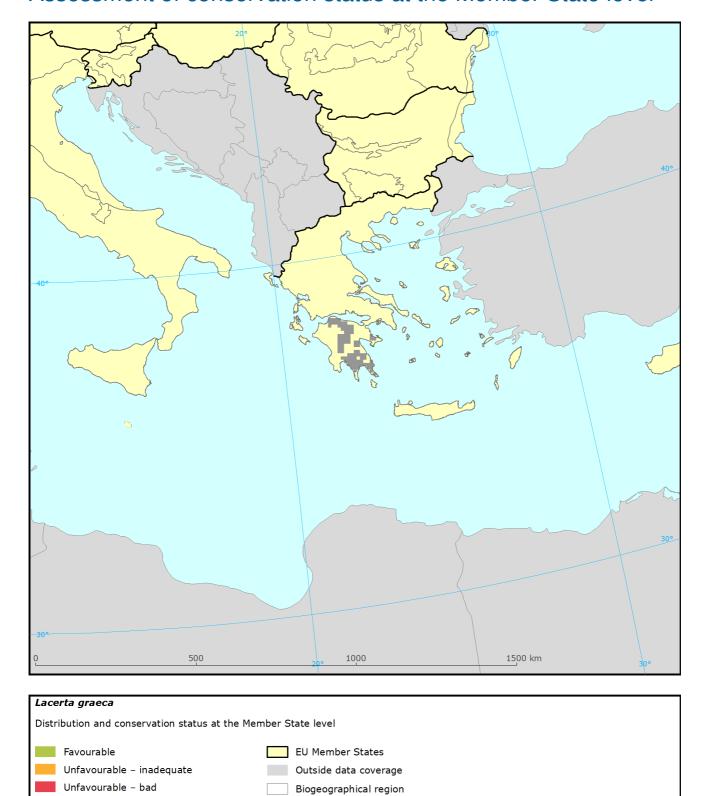

Assessment of conservation status at the European biogeographical level

See the endnote for more informationⁱ

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the Member State level

The map shows both Conservation Status and distribution using a $10 \text{ km} \times 10 \text{ km}$ grid. Conservation status is assessed at biogeographical level. Therefore the representation in each grid cell is only illustrative.

Unknown

Species: Lacerta graeca

Report under the Article 17 of the Habitats Directive

_	Conservation status of parameters				Current	Trend in	% in	Previous	Reason
MS Region	Range	Population	Habitat	Future prospects	Current CS	CS	region	CS	for change
GR MED	FV	XX	XX	XX	XX		100.0	XX	

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the Article 17 Reference Portal. Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

Ten most frequently reported 'highly important' pressures

Code Activity	Frequency						
No 'highly important' pressures were reported.							
Ten most frequently reported 'highly important' threats							
Code Activity	Frequency						
No 'highly important' threats were reported.							

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at: http://bd.eionet.europa.eu/article17/reports2012/species/summary/? group=Reptiles&period=3&subject=Lacerta+graeca

Species: Lacerta graeca

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the European biogeographical level: Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.
