

Armeria sampaioi

Annex	V
Priority	No
Species group	Vascular plants
Regions	Mediterranean

The herb *Armeria sampaioi* grows only in northern and central Portugal (Serra da Estrela) in acidophilous grasslands (high mountain meadows of habitat 6160 - Oro-Iberian *Festuca indigesta* grasslands), on granite outcrops, or in horizontal cracks of granitic rocks. This species is reported only from the Mediterranean region. The species is assessed as Vulnerable (VU) in the IUCN European Red List.

The conservation status is 'Unfavourable-Inadequate', with unknown trend, due to the status of the population in the only reporting country - Portugal. The status was assessed as 'Unfavourable-Inadequate' in the previous reporting period due to the status of future prospects, which in the current period are assessed as 'Unknown'.

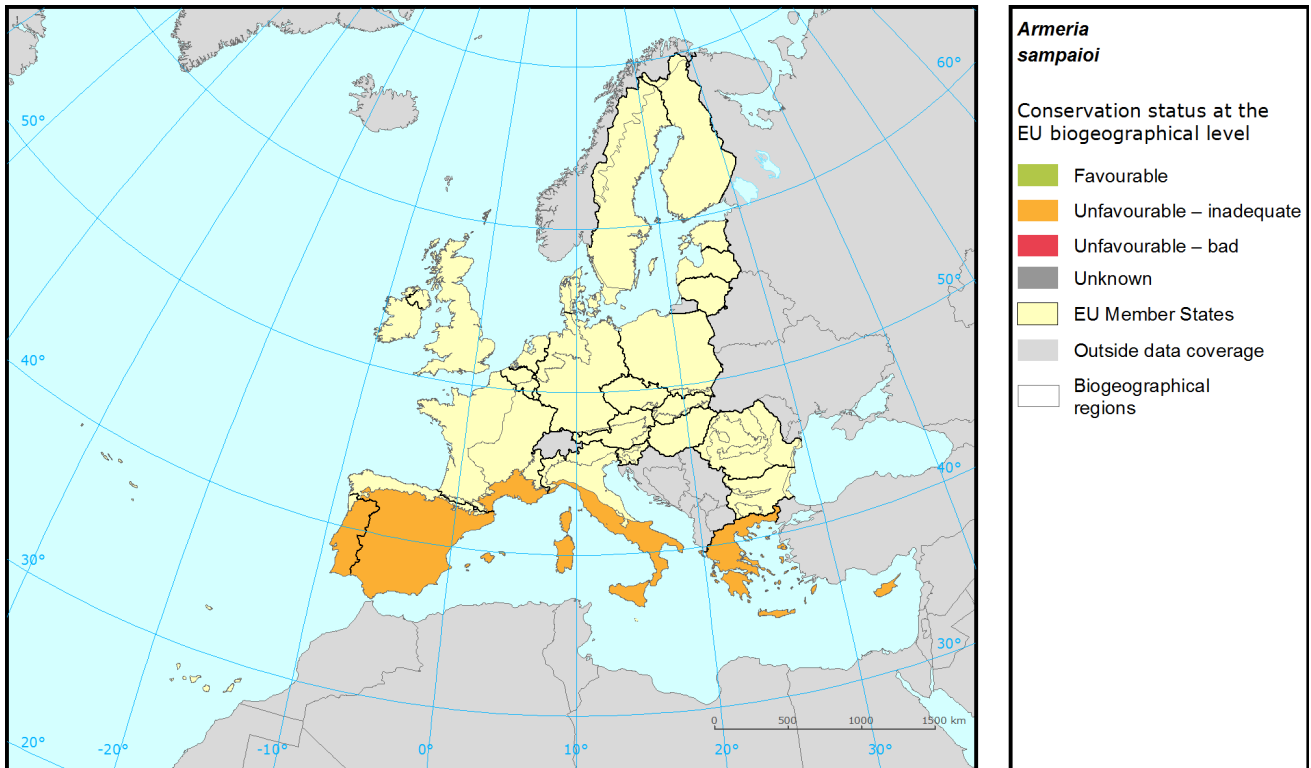

The main pressures and threats (of medium importance) are burning, and overuse (trampling).

There are no changes in overall conservation status between the 2001-06 and 2007-12 reports.

Species: *Armeria sampaioi*

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the European biogeographical level

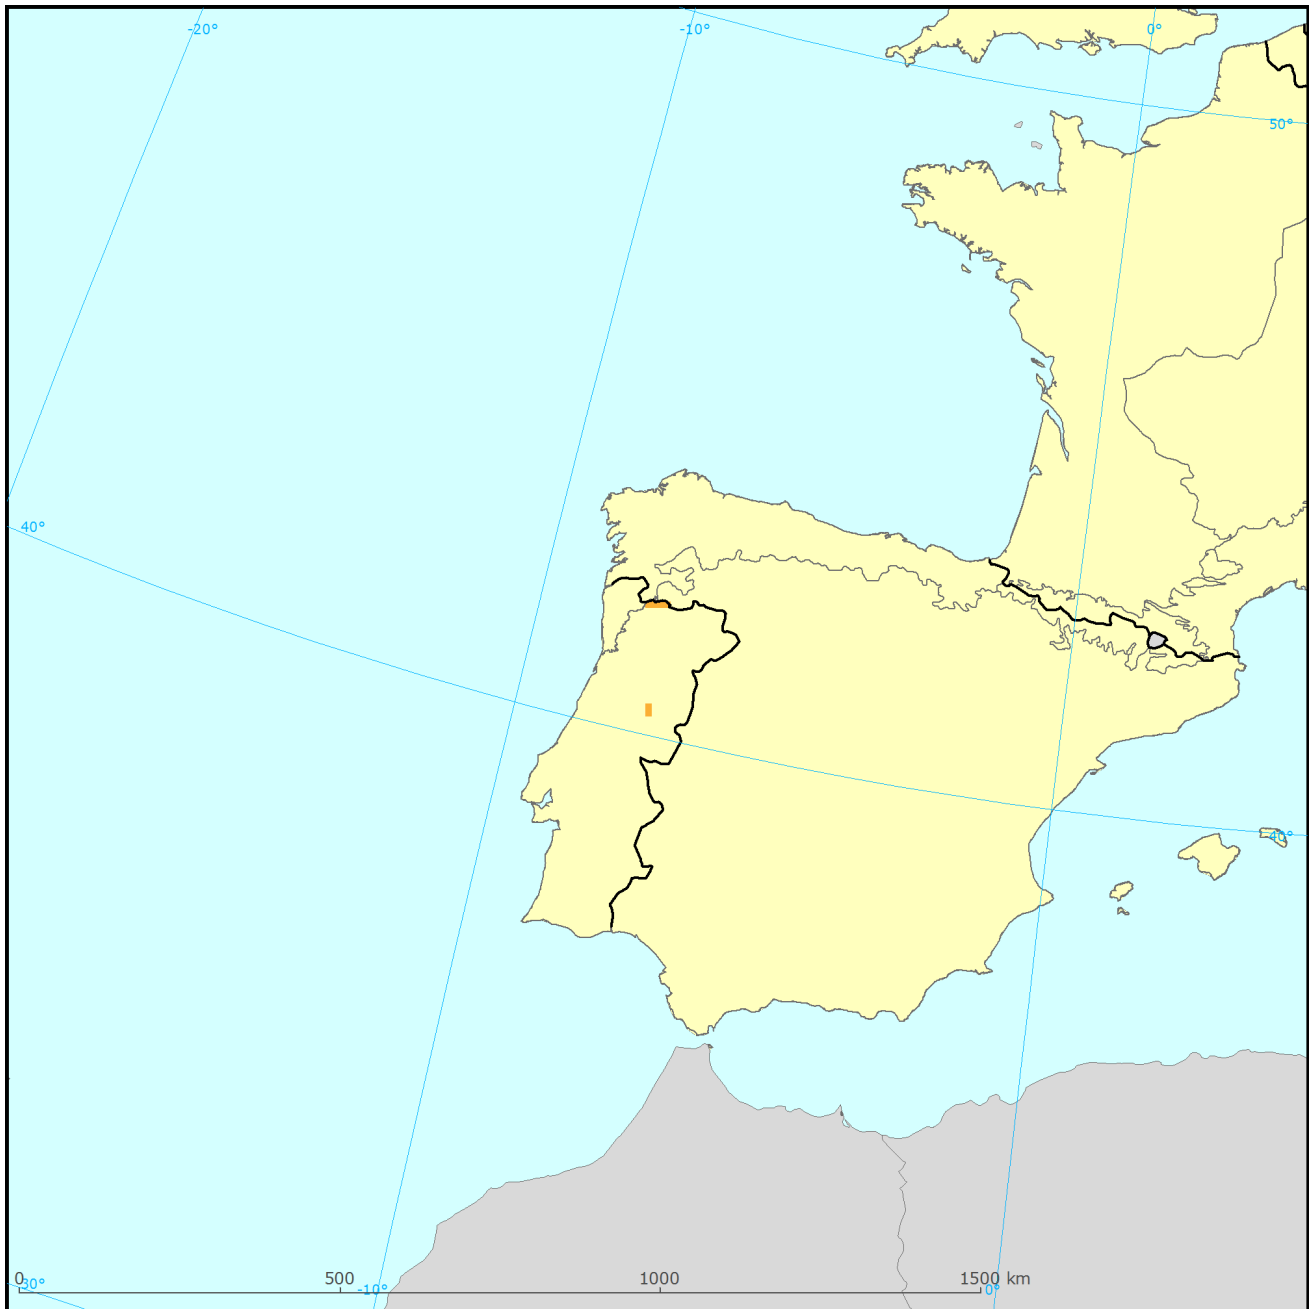

Region	Conservation status (CS) of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
	Range	Population	Habitat	Future prospects					
MED	FV	U1	XX	XX	U1	x	100	U1	

See the endnote for more informationⁱ

Species: *Armeria sampaioi*

Report under the Article 17 of the Habitats Directive

Assessment of conservation status at the Member State level

Armeria sampaioi

Distribution and conservation status at the Member State level

- | | |
|---------------------------|------------------------|
| Favourable | EU Member States |
| Unfavourable - inadequate | Outside data coverage |
| Unfavourable - bad | Biogeographical region |
| Unknown | |

The map shows both Conservation Status and distribution using a 10 km x 10 km grid. Conservation status is assessed at biogeographical level. Therefore the representation in each grid cell is only illustrative.

Species: *Armeria sampaioi*

Report under the Article 17 of the Habitats Directive

MS Region	Conservation status of parameters				Current CS	Trend in CS	% in region	Previous CS	Reason for change
	Range	Population	Habitat	Future prospects					
PT MED	FV	U1	XX	XX	U1	x	100.0	U1	

Knowing that not all changes in conservation status between the reporting periods were genuine, Member States were asked to give the reasons for changes in conservation status. Bulgaria and Romania only joined the EU in 2007 and Greece did not report for 2007-12 so no reason is given for change for these countries. Greek data shown above is from 2001-06.

Main pressures and threats reported by Member States

Member States were asked to report the 20 most important threats and pressures using an agreed hierarchical list which can be found on the [Article 17 Reference Portal](#). Pressures are activities which are currently having an impact on the species and threats are activities expected to have an impact in the near future. Pressures and threats were ranked in three classes 'high, medium and low importance'; the tables below only show threats and pressures classed as 'high', for some species there were less than ten threats or pressures reported as highly important.

Ten most frequently reported 'highly important' pressures

Code	Activity	Frequency
No 'highly important' pressures were reported.		

Ten most frequently reported 'highly important' threats

Code	Activity	Frequency
No 'highly important' threats were reported.		

This information is derived from the Member State national reports submitted to the European Commission under Article 17 of the Habitats Directive in 2013 and covering the period 2007-2012. More detailed information, including the MS reports, is available at:

<http://bd.eionet.europa.eu/article17/reports2012/species/summary/?group=Vascular+plants&period=3&subject=Armeria+sampaioi>

Species: *Armeria sampaioi*

Report under the Article 17 of the Habitats Directive

i Assessment of conservation status at the European biogeographical level: Current Conservation Status (Current CS) shows the status for the reporting period 2007-2012, Previous Conservation Status (Previous CS) for the reporting period 2000-2006. Reason for change in conservation status between the reporting periods indicates whether the changes in the status were genuine or not genuine. Previous Conservation Status was not assessed for Steppic, Black Sea and Marine Black Sea regions. For these regions the Previous status is therefore considered as 'unknown'. The percentage of the species population occurring within the biogeographical/marine region (% in region) is calculated based on the area of GIS distribution.
